Curve-rational functions

János Kollár, Wojciech Kucharz and Krzysztof Kurdyka

Abstract. Let W be a subset of the set of real points of a real algebraic variety X. We investigate which functions $f : W \to \mathbb{R}$ are the restrictions of rational functions on X. We introduce two new notions: *curve-rational functions* (i.e., continuous rational on algebraic curves) and *arc-rational functions* (i.e., continuous rational on arcs of algebraic curves). We prove that under mild assumptions the following classes of functions coincide: continuous hereditarily rational (introduced recently by the first named author), curve-rational and arc-rational. In particular, if W is semialgebraic and f is arc-rational, then f is continuous and semialgebraic. We also show that an arc-rational function defined on an open set is arc-analytic (i.e., analytic on analytic arcs). Furthermore, we study rational functions on products of varieties. As an application we obtain a characterization of regular functions. Finally, we get analogous results in the framework of complex algebraic varieties.

Key words. Continuous rational functions, regular functions, semialgebraic functions, Bertini Theorem.
